The enhanced SBT® Automation Package (w/laptop) offers the capacity to operate up to four, 2-place, Direct Cool units simultaneously and independently.

The harsh winter of 1980 contributed to numerous engine failures from gelated oil. Savant Labs developed the SBT® method to understand structure formation in gelation-susceptible engine oils and the conditions that can lead to catastrophic air-binding failures in engines. Tannas introduced the patented SBT® in the mid-1980s and began manufacturing and marketing liquid cooling bath models. The SBT® has been included in several automotive engine oil specifications since the early 1990’s.

Low-Temperature Pumpability & Gelation Index:
The Scanning Brookfield Technique™ (SBT®) measures apparent viscosity of fresh, sooted, or highly oxidized engine oils at low temperatures. It determines the susceptibility of engine oils to flow-limited and air-binding responses during slow cooling conditions by providing continuous rheological data over a broad temperature range (+90°C to -45°C). Viscometric data obtained from this technique provide essential insights regarding the effects of base oils, wax content, VI Improvers, Pour Point Depressants, and other additives on the pumpability and gel structure of engine oils, fuels, and other liquid petroleum products.

Innovation
The SBT® offers the most complete analysis available of the low-temperature rheological properties of engine oils and liquid petroleum products, and is the only technique capable of generating the Gelation Index. Tannas has continually improved the test design, functionality and safety. The SBT® Direct Cool incorporates several new patented refrigeration techniques, including the ability to both pre-heat and precisely cool two samples per unit according to the designated test methods.

Features
- The non-liquid system eliminates flammable bath mediums from laboratory environments.
- Dual position, independent test sample design.
- Simple vertical alignment and centering of viscometers.
- Small bench-top footprint.
- Self-contained pre-heating: Heats samples to 90°C prior to analysis, while remaining in position.
- Internal automatic dry air system removes moisture that accumulates during the test.
- Programmable Temperature Controller maintains bath temperature within ±0.1°C to -45°C.

The enhanced SBT® Automation Package (w/laptop) offers the capacity to operate up to four, 2-place, Direct Cool units simultaneously and independently.

ASTM D5133, D7110
Continuous viscosity measurement of engine oils throughout cooling profile of 1°C/hour from -5 to -40°C. Required for:
- ILSAC GF-2 through upcoming GF-6 (A&B) and dexos™ Engine Oil Specifications.

ASTM D5133
JPI-55-56-99
SH/T0732
Continuous viscosity measurement of used and soot-containing engine oils throughout cooling profile of 3°C/hour from -5 to -40°C.

**Parts & Accessories**

**ASTM D5133 & D7110:**
100750: Tannas SBT2010 Automation Package
100854: SBT® Direct Cool Viscometer (TAV-III)
160022: SBT® Direct Cool Stator
160021: SBT® Direct Cool Adapter Assembly
160011: SBT® Direct Cool Rotor
100031: Female Hook
100032: Male Hook
040013: LNP-5 Calibration Fluid
030007: Gelation Index Reference Oil (GIR-150)

**Automated Software**

The SBT® Automation Software Package generates a comprehensive analysis of low-temperature pumpability and the gelation phenomenon. The Sample Report screen displays real-time viscosity/temperature graphing and reporting over the selected temperature range. It also generates the Gelation Index and the Gelation Index Temperature at the end of the test by using the first derivative of the MacCoull-Walther-Wright viscosity/temperature equation. User Selectable Fields provide operators the versatility of entering critical temperatures after the test to obtain the sample's associated viscosity at those temperatures.

**Additional TANNAS CO. Precision Laboratory Instruments**

- **Tannas Foam Air Bath (TFAB™)**
  - ASTM D6892, D6082, IP146
  - Non-liquid bath
  - 24°C to 150°C range

- **Tapered Bearing Simulator (TBS™) Viscometer**
  - ASTM D4683, D6616, CEC L-36-A90, IP370
  - High-Temperature, High-Shear (HTHS) Viscosity

- **Quantum® Oxidation Tester**
  - ASTM D2272, D2112, D4742, D942, IP229
  - RPVOT, TFOUT, Grease Oxidation
  - Non-liquid ‘dry cylinder’ sample heating
